Introduction to High Performance Scientific Computing David L. Chopp, 2019-03-01 Based on a course developed by the author Introduction to High Performance Scientific Computing introduces methods for adding parallelism to numerical methods for solving differential equations It contains exercises and programming projects that facilitate learning as well as examples and discussions based on the C programming language with additional comments for those already familiar with C The text provides an overview of concepts and algorithmic techniques for modern scientific computing and is divided into six self contained parts that can be assembled in any order to create an introductory course using available computer hardware Part I introduces the C programming language for those not already familiar with programming in a compiled language Part II describes parallelism on shared memory architectures using OpenMP Part III details parallelism on computer clusters using MPI for coordinating a computation Part IV demonstrates the use of graphical programming units GPUs to solve problems using the CUDA language for NVIDIA graphics cards Part V addresses programming on GPUs for non NVIDIA graphics cards using the OpenCL framework Finally Part VI contains a brief discussion of numerical methods and applications giving the reader an opportunity to test the methods on typical computing problems

Numerically Solving Polynomial Systems with Bertini Daniel J. Bates, Jonathan D. Hauenstein, Andrew J. Sommese, Charles W. Wampler, 2013-11-08 This book is a guide to concepts and practice in numerical algebraic geometry the solution of systems of polynomial equations by numerical methods Through numerous examples the authors show how to apply the well received and widely used open source Bertini software package to compute solutions including a detailed manual on syntax and usage options The authors also maintain a complementary web page where readers can find supplementary materials and Bertini input files Numerically Solving Polynomial Systems with Bertini approaches numerical algebraic geometry from a user s point of view with numerous examples of how Bertini is applicable to polynomial systems It treats the fundamental task of solving a given polynomial system and describes the latest advances in the field including algorithms for intersecting and projecting algebraic sets methods for treating singular sets the nascent field of real numerical algebraic geometry and applications to large polynomial systems arising from differential equations Those who wish to solve polynomial systems can start gently by finding isolated solutions to small systems advance rapidly to using algorithms for finding positive dimensional solution sets curves surfaces etc and learn how to use parallel computers on large problems These techniques are of interest to engineers and scientists in fields where polynomial equations arise including robotics control theory economics physics numerical PDEs and computational chemistry

Scientific Computing in Modern C++ Victor Eijkhout, 2026-02-10 If you are an aspiring computer programmer with a basic knowledge of C and want to deepen your understanding of the language specifically for use in scientific computing this unique book is for you It is the only book to discuss modern C from a scientific

computing perspective covering a wide range of topics including the finer points of C specific idioms of C in scientific computing parallelism considerations of hardware and performance and carpentry topics such as CMake that extend beyond basic programming to make you a more productive programmer This book focuses on computing idioms and applications rather than a complete treatment of the C language as well as peripheral carpentry topics and is designed to take students to a level where they can be productive in a scientific programming project The C topics discussed are chosen for their relevance to computing and other topics are purposely excluded Additionally several topics relevant to scientific computing are included that are not intimately tied to C as a language Scientific Computing in Modern C is mainly for students specializing in scientific computing who are using C as their primary language intermediate C programmers who want to get into scientific computing and practitioners who want to transition from older languages to C It can also be used as a textbook in a specialized course on C for computational science students with prior exposure to C or Fortran

Parallel Processing for Scientific Computing Michael A. Heroux, Padma Raghavan, Horst D. Simon, 2006-01-01 Parallel processing has been an enabling technology in scientific computing for more than 20 years This book is the first in depth discussion of parallel computing in 10 years it reflects the mix of topics that mathematicians computer scientists and computational scientists focus on to make parallel processing effective for scientific problems Presently the impact of parallel processing on scientific computing varies greatly across disciplines but it plays a vital role in most problem domains and is absolutely essential in many of them Parallel Processing for Scientific Computing is divided into four parts The first concerns performance modeling analysis and optimization the second focuses on parallel algorithms and software for an array of problems common to many modeling and simulation applications the third emphasizes tools and environments that can ease and enhance the process of application development and the fourth provides a sampling of applications that require parallel computing for scaling to solve larger and realistic models that can advance science and engineering

The Art of Differentiating Computer Programs Uwe Naumann, 2012-01-01 This is the first entry level book on algorithmic also known as automatic differentiation AD providing fundamental rules for the generation of first and higher order tangent linear and adjoint code The author covers the mathematical underpinnings as well as how to apply these observations to real world numerical simulation programs Readers will find examples and exercises including hints to solutions the prototype AD tools dco and dcc for use with the examples and exercises first and higher order tangent linear and adjoint modes for a limited subset of C C provided by the derivative code compiler dcc a supplementary website containing sources of all software discussed in the book additional exercises and comments on their solutions growing over the coming years links to other sites on AD and errata

[PETSc for Partial Differential Equations: Numerical Solutions in C and Python](#) Ed Bueler, 2020-10-22 The Portable Extensible Toolkit for Scientific Computation PETSc is an open source

library of advanced data structures and methods for solving linear and nonlinear equations and for managing discretizations. This book uses these modern numerical tools to demonstrate how to solve nonlinear partial differential equations (PDEs) in parallel. It starts from key mathematical concepts such as Krylov space methods, preconditioning, multigrid, and Newton's method. In PETSc, these components are composed at run time into fast solvers. Discretizations are introduced from the beginning with an emphasis on finite difference and finite element methodologies. The example C programs of the first 12 chapters listed on the inside front cover solve mostly elliptic and parabolic PDE problems. Discretization leads to large sparse and generally nonlinear systems of algebraic equations. For such problems, mathematical solver concepts are explained and illustrated through the examples with sufficient context to speed further development. PETSc for Partial Differential Equations addresses both discretizations and fast solvers for PDEs, emphasizing practice more than theory. Well-structured examples lead to run-time choices that result in high solver performance and parallel scalability. The last two chapters build on the reader's understanding of fast solver concepts when applying the Firedrake Python finite element solver library. This textbook, the first to cover PETSc programming for nonlinear PDEs, provides an on-ramp for graduate students and researchers to a major area of high performance computing for science and engineering. It is suitable as a supplement for courses in scientific computing or numerical methods for differential equations.

SIAM Journal on Control and Optimization Society for Industrial and Applied Mathematics, 1976. Contains research articles on the mathematics and applications of control theory and on those parts of optimization theory concerned with the dynamics of deterministic or stochastic systems in continuous or discrete time or otherwise dealing with differential equations, dynamics in infinite dimensional spaces or fundamental issues in variational analysis and geometry.

Implicit Filtering C. T. Kelley, 2011-01-01. Implicit filtering is a way to solve bound-constrained optimization problems for which derivative information is not available. Unlike methods that use interpolation to reconstruct the function and its higher derivatives, implicit filtering builds upon coordinate search and then interpolates to get an approximation of the gradient. The author describes the algorithm, its convergence theory, and a new MATLAB implementation and includes three case studies. This book is unique in that it is the only one in the area of derivative-free or sampling methods and is accompanied by publicly available software. It is also designed as a software manual and as a reference for implicit filtering; one can approach the book as a consumer of the software, as a student, or as a researcher in sampling and derivative-free methods. The book includes a chapter on convergence theory that is both accessible to students and an overview of recent results on optimization of noisy functions, including results that depend on non-smooth analysis and results on the handling of constraints. Implicit filtering is used in applications in electrical, civil, and mechanical engineering.
