*The Undecidable* Martin Davis,2004-01-01 A valuable collection both for original source material as well as historical formulations of current problems The Review of Metaphysics Much more than a mere collection of papers A valuable addition to the literature Mathematics of Computation An anthology of fundamental papers on undecidability and unsolvability by major figures in the field this classic reference is ideally suited as a text for graduate and undergraduate courses in logic philosophy and foundations of mathematics It is also appropriate for self study The text opens with Godel s landmark 1931 paper demonstrating that systems of logic cannot admit proofs of all true assertions of arithmetic Subsequent papers by Godel Church Turing and Post single out the class of recursive functions as computable by finite algorithms Additional papers by Church Turing and Post cover unsolvable problems from the theory of abstract computing machines mathematical logic and algebra and material by Kleene and Post includes initiation of the classification theory of unsolvable problems Supplementary items include corrections emendations and added commentaries by Godel Church and Kleene for this volume s original publication along with a helpful commentary by the editor [The Undecidable](#) Martin Davis,1955 **The Undecidable** Martin D. transhumanist in nature Finally avenues of research that may allow these disruptive technologies to circumvent the cybernetic fate are indicated It is proposed that emerging technologies ultimately entail an affirmation of humanity In the Scope of Logic, Methodology and Philosophy of Science Peter Gärdenfors, Jan Wolenski, K. **The Essence of Rum: a Theory of the Intensional and Extensional Aspects of Lisp-type Computation** Carolyn L. Talcott, Stanford University. Computer Science Department, 1985 Rum is a theory of applicative side effect free computations over an algebraic data structure It goes beyond a theory of functions computed by programs treating both intensional and extensional aspects of computation Powerful programming tools such as streams object oriented programming escape mechanisms and co routines can be represented Intensional properties include the number of multiplications executed the number of context switches and the maximum stack depth required in a computation Extensional properties include notions of equality for streams and co routines and characterization of functionals implementing strategies for searching tree structured spaces Precise definitions of informal concepts such as stream and co routine are given and their mathematical theory is developed Operations on programs treated include program transformations which introduce functional and control abstractions a compiling morphism that provides a representation of control abstractions as functional abstractions and operations that transform intensional properties to extensional properties The goal is not only to account for programming practice in Lisp but also to improve practice by providing mathematical tools for developing programs and building programming systems Rum views computation as a process of generating computation structures trees for context independent computations and sequences for context dependent computations The recursion theorem gives a fixed point function that computes computationally minimal fixed points The context insensitivity theorem says that context dependent computations are uniformly parameterized by the calling context and that computations in which context dependence is localized can be treated like context independent computations

*Computation as Logic* René Lalement, 1993 Logic plays an important role in the two areas of computer science reduction and resolution respectively associated with functional programming and logic programming This book illustrates that logic is not only a language in which one can accurately state facts or knowledge as in artificial intelligence but also that programming itself is a logical activity

**The Bulletin of Symbolic Logic**, 2008 *The History of Mathematics from*

*Antiquity to the Present* Joseph W. Dauben, 1985      Copyright, Data and Creativity in the Digital Age Julian Warner, 2020-09-01

The Supreme Court of the United States in *Feist v Rural* 1991 required that databases must have a minimal degree of creativity for copyright. The judgment was highly significant and the subsequent period is understood as the post *Feist* era. It has been globally influential. However, the decision is extremely complex and remains unsatisfactorily interpreted. In particular, it has been impossible to illuminate the creativity requirement. The book gives an account of the decision's conceptual structure, focusing on its full delineation of the opposite to creativity. In a radical and unprecedented innovation, it is correlated with an automatic computational process. Creativity itself is understood as non-computational or directly human activity concerned with meaning. Determining the presence of creativity is reduced to a four-stage test. This work then has acute practical current relevance to property in data in the digital age; it will also be of theoretical interest to and is aimed at researchers, practitioners, and students of intellectual property worldwide.
