Theory Of Optimum Aerodynamic Shapes:

On the Theory of Optimum Aerodynamic Shapes ,1968 The physical models of interest in the theory of optimum aerodynamic shapes are reviewed The corresponding mathematical models are illustrated for both problems involving one independent variable and problems involving two independent variables Then the solution process is considered Finally new trends in the theory of optimum aerodynamic shapes as well as problems of interest in the immediate future are outlined
Author Theory of Optimum Aerodynamic Shapes Angelo Miele,1965 **Theory of optimum aerodynamic shapes** ,1965 **Theory of Optimum Aerodynamic Shapes ... Edited by Angelo Miele** Angelo MIELE,1965 **Theory of Optimum Aerodynamic Shapes** Angelo Miele,1965 Scientific and Technical Aerospace Reports ,1965 Aerodynamic Shape Optimization of Supersonic Aircraft Configurations Via an Adjoint Formulation on Parallel Computers Research Institute for Advanced Computer Science (U.S.),196 Abstract This work describes the application of a control theory based aerodynamic shape optimization method to the problem of supersonic aircraft design The design process is greatly accelerated through the use of both control theory and a parallel implementation on distributed memory computers Control theory is employed to derive the adjoint differential equations whose solution allows for the evaluation of design gradient information at a fraction of the computational cost required by previous design methods 13 12 44 38 The resulting problem is then implemented on parallel distributed memory architectures using a domain decomposition approach an optimized communication schedule and the MPI Message Passing Interface Standard for portability and efficiency The final result achieves very rapid aerodynamic design based on higher order computational fluid dynamics methods CFD In our earlier studies the serial implementation of this design method 19 20 21 23 39 25 40 41 42 43 9 was shown to be effective for the optimization of airfoils wings wing bodies and complex aircraft configurations using both the potential equation and the Euler equations 39 25 In our most recent paper the Euler method was extended to treat complete aircraft configurations via a new multiblock implementation Furthermore during the same conference we also presented preliminary results demonstrating that this basic methodology could be ported to distributed memory parallel computing architectures 24 In this paper our concern will be to demonstrate that the combined power of these new technologies can be used routinely in an industrial design environment by applying it to the case study of the design of typical supersonic transport configurations A particular difficulty of this test case is posed by the propulsion airframe integration *International Aerospace Abstracts* ,1999

Optimization and Computational Fluid Dynamics Dominique Thévenin,Gábor Janiga,2008-01-08 The numerical optimization of practical applications has been an issue of major importance for the last 10 years It allows us to explore reliable non trivial configurations differing widely from all known solutions The purpose of this book is to introduce the state of the art concerning this issue and many complementary applications are presented *Aerodynamic Shape Optimization of Complex Aircraft Configurations Via an Adjoint Formulation* James Reuther,1996 Abstract This work describes the

implementation of optimization techniques based on control theory for complex aircraft configurations Here control theory is employed to derive the adjoint differential equations the solution of which allows for a drastic reduction in computational costs over previous design methods 13 12 43 38 In our earlier studies 19 20 22 23 39 25 40 41 42 it was shown that this method could be used to devise effective optimization procedures for airfoils wings and wing bodies subject to either analytic or arbitrary meshes Design formulations for both potential flows and flows governed by the Euler equations have been demonstrated showing that such methods can be devised for various governing equations 39 25 In our most recent works 40 42 the method was extended to treat wing body configurations with a large number of mesh points verifying that significant computational savings can be gained for practical design problems In this paper the method is extended for the Euler equations to treat complete aircraft configurations via a new multiblock implementation New elements include a multiblock multigrid flow solver a multiblock multigrid adjoint solver and a multiblock mesh perturbation scheme Two design examples are presented in which the new method is used for the wing redesign of a transonic business jet

Computational Fluid Dynamics for the 21st Century Mohamed Hafez, Koji Morinishi, Jacques Periaux, 2013-03-09 The goal of this book is to present the new trend of Computational Fluid Dynamics CFD for the 21 st Century It consists of papers presented at a symposium honoring Prof No buyuki Satofuka on the occasion of his 60th birthday The symposium entitled Computational Fluid Dynamics fOT the 21st Century was held at Kyoto Institute of Technology KIT in Kyoto Japan on July 15 17 2000 The symposium was hosted by KIT as a memorial event celebrating the 100 year anniversary of this establishment The invited speakers were from Ja pan as weil as from the international community in Asia Europe and North America It is a great pleasure to dedicate this book to Prof Satofuka in appreciation ofhis contributions to this field During the last 30 years Prof Satofuka made many important contributions to CFD ad vancing the numerics and our understanding of flow physics in different regimes The details of his contributions are discussed in the first chapter The book contains chapters covering re lated topics with emphasis on new promising directions for the 21 st Century The chapters of the book reflect the 10 sessions of the symposium on both the numerics and the applications including grid generation and adaptation new numerical schemes optimi zation techniques and parallel computations as weil as applications to multi sc ale and multi physics problems design and flow control and new topics beyond aeronautics In the follow ing the chapters of the book are introduced

New Design Concepts for High Speed Air Transport H. Sobieczky, 2014-05-04 This book presents the challenges the tools and the concepts for developing economically viable high speed civil transport aircraft under environmental constraints Computational tools for aircraft design and optimization are outlined and application in an industrial environment is shown for new and innovative case studies

Large-Scale PDE-Constrained Optimization in Applications Subhendu Bikash Hazra, 2009-12-16 With continuous development of modern computing hardware and applicable numerical methods computational fluid dynamics CFD has reached certain level of maturity so that it is being used routinely by scientists and engineers for flow analysis Since most of the real life applications involve some kind of optimization it has been natural to extend the use of CFD tools from flow simulation to simulation based optimization However the transition from simulation to optimization is not straight forward it requires proper interaction between advanced CFD methodologies and state of the art optimization algorithms The ultimate goal is to achieve optimal solution at the cost of few flow solutions There is growing number of search activities to achieve this goal This book results from my work done on simulation based optimization problems at the Department of Mathematics University of Trier and reported in my postdoctoral thesis Habilitationsschrift accepted by the Faculty IV of this University in 2008 The focus of the work has been to develop mathematical methods and algorithms which lead to efficient and high performance computational techniques to solve such optimization problems in real life applications Systematic development of the methods and algorithms are presented here Practical aspects of implementations are discussed at each level as the complexity of the problems increase supporting with enough number of computational examples **Non-classical Vibrations of Arches and Beams** Igor' Alekseevich Karnovskii, 2004 The demand for complex high technology structures has increased the required accuracy of structural calculations This in depth reference covers solutions to the crucial vibration problems of beam and arch design It covers vibration analysis compressive loads elastic foundations and more transverse vibration equations dynamics of deformable systems and optimal designed beams *Index Aeronauticus* ,1966 **Fluid Dynamics** ,1976
